We'll see soon enough 😊

As 27hz is a earth shulemans frequency that is impossible to separate that way.
Further the 180hz you claim is far above these ELFs produced by the earth, there is no noise to separate it from.
Your in pure fantasy land and your data is impossible bullshit...
If it was there the lens would have found the 180hz, and to get rid of the 27hz earth noise I would need to use seismometers attached to the LIGO mirrors to measure ground motion and then subtract its effect from the strain data. This has been done successfully below 20 Hz, but at 27 Hz the coherence between ground motion and mirror motion is weaker (basically measuring the elf coupling in the ground state and filter that noise from the received signal) ..

You not speaking to some nigger straight from the cotton field, I actually know my shit...

Your method if seriously flawed and giving you the false data your manipulating it to give.

As for me i just have to wait for the voyager data as it is not coupled to the ELF.

If your paper is published expect a factual peer review debunking your process as psudo-science at best...

Besides eventually my Grand Unified field theory which already has empirical evidence in multiple forms will be accepted and it debunks your theories as incomplete (only a upper harmonic without base- hydrogen line).

You will never get the Nobel prize in physics...

When nasa releases the data is will have all the evidence in will ever need.

Good luck...

Peter,

Your assertion that the H1 array data is 'pure fiction' is factually incorrect and demonstrates a fundamental misunderstanding of the methodology applied.

The 180Hz core resonance was not 'stated'; it was physically measured and extracted via the Finite-State Boolean masking protocol specifically designed to isolate the signal from environmental noise, including the very 27Hz artifacts you reference.

If you cannot replicate the findings using the raw, scrubbed H1 array I provided, the error lies within your interpretation or the execution of your Harmonic_lens.py script against verified empirical metrics.

The data is sound. My IP is protected. Any further correspondence regarding the validity of the T and C Estate audit data will be directed to my counsel.

this proves your a con job as there is no 180Hz as you stated and the detectors can not read the noise at 27hz at this point in time.

it proves the file you sent was pure fiction you made up to get credit on my work.

you can not argue with the evidence so just try to sue me, i dare you...
