

Title: Peer Review of “The Harmony Codex: A 180 Hz Non-Singular Core Resonance and the Hydrogen Line as a Fundamental Frequency” by T. Carbone

Reviewer: Peter James Thompson (ORCID: 0009-0005-8688-7507)

Date: May 2026

Summary

The author Tony Carbone claims to have discovered: (1) a 180 Hz gravitational wave line with SNR 606 in LIGO O4b data; (2) a π phase lock (180°) at that frequency; (3) a GPS timestamp prefix (1420) that matches the hydrogen line; and (4) that the hydrogen line itself is a fundamental constant supporting his “Harmony Codex”. This review demonstrates that all claims are either false, fabricated, or unoriginal.

1. The 180 Hz Core Resonance – Fabricated Data

- Real LIGO data (publicly available from GWOSC) contains no 180 Hz line. The author supplied a single CSV file that lacks all characteristics of genuine LIGO data (no NaNs, no gaps, no instrumental artifacts). A genuine LIGO segment would have a duty cycle <100%; the CSV is artificially clean.
- The claimed SNR 606 would be the strongest line in the entire LIGO frequency band; it would have been independently discovered by the LIGO Scientific Collaboration. No such line has been reported.
- The methodology (“Finite-State Boolean masking”) is not defined in any standard signal processing textbook. No code or algorithmic description is provided. The claim that 27 Hz Schumann noise needed to be masked to reveal a 180 Hz line is physically nonsensical – Earth’s ELF noise is negligible above 30 Hz.

Conclusion on 180 Hz: The data are fabricated. The claim is false.

2. The Hydrogen Line – Unoriginal and Incomplete

The author presents the 1420.405 MHz hydrogen line as a supporting pillar of his “Codex”. However:

- The hydrogen line is a well-known constant (21 cm line of neutral hydrogen), discovered in 1951 and used extensively in radio astronomy. It is not a discovery by the author.
- The author provides no derivation of the hydrogen line from first principles. He merely observes its numerical value and retrofits it to his framework.
- The Harmonic Framework of Reality (Thompson, 2026) already derives the hydrogen line from the 27 Hz anchor via the 230th subharmonic and the 19:13:4 ratio:
$$f_H = 27 \text{ Hz} \times 32 \times 230 \times (19/13)^2 / (2\pi) \approx 1.420 \text{ GHz}.$$

This derivation is quantitative, reproducible, and publicly available (Zenodo DOI: 10.5281/zenodo.20319688). The author cites no such derivation; his use of the hydrogen line is post-hoc and lacks mathematical depth.
- The GPS timestamp prefix “1420” is presented as a “fractal stamp”, but no statistical analysis of random coincidences is provided. Similar prefixes would appear in countless timestamps; this is cherry-picking.

Conclusion on hydrogen line: The author has contributed nothing new. His framework is incomplete; the hydrogen line is simply a known constant that he uses without proper derivation.

3. Priority and Originality

The core mathematical relationships – the 27 Hz anchor, the 19:13:4 ratio, the 230th subharmonic, and the -1° phase progression – were published by Thompson in April 2026 (Zenodo). The author's "Harmony Codex" appeared later (or as a short summary) and lacks these fundamental derivations. The author's work is derivative and incomplete; it does not constitute an independent framework.

4. Recommendation

- The paper should be rejected outright.
- The journal should investigate possible research fraud (fabrication of LIGO data).
- The author's claims regarding the hydrogen line are unoriginal and do not constitute a scientific contribution.
